INTRODUCTION

- Neighborhood environments are known to impact health behaviors.
- This project investigated childhood obesity rates and associations with neighborhood environment characteristics: walkability, parks, and poverty.

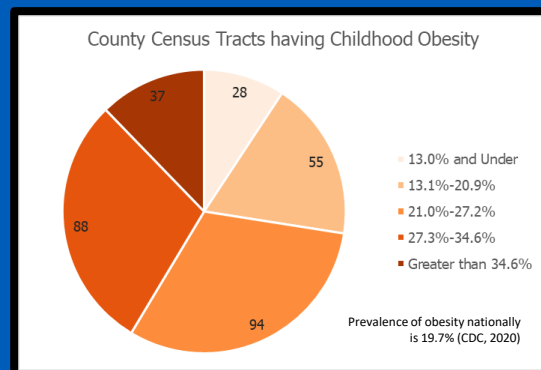

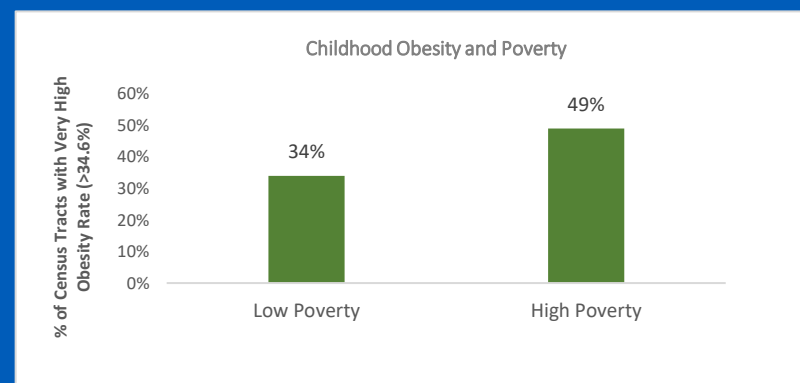

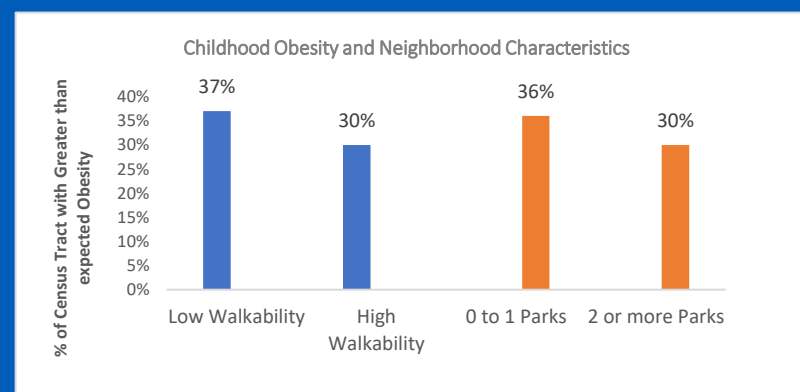

METHOD

- ~20,000 Children's Mercy primary care patients ages 6-17 (2017-2020)
- Obesity rates were calculated and mapped for all census tracts in the 6-county Kansas City region with ≥ 15 patients.
- Publicly available socioeconomic and built environment data were integrated.
- Park quality was measured using observational audits.
- Mixed effects regression models were used to test associations and were adjusted for sociodemographics.

Neighborhood Environments and Childhood Obesity in the Kansas City Region

Neighborhood Characteristic	Effect on BMIz
Walkability and BMIz (in 9-17 year olds)	-0.03 (-0.06, 0.00); $p=.033$
Parks and BMIz	-0.02 (-0.04, -0.01); $p=.020$
Park Quality and Obesity (odds ratio)	0.94 (0.89, 0.98); $p=.034$

RESULTS

- The association between greater walkability and lower BMIz was specific to 9–17-year-olds
- Children in the 25% highest walkable tracts were 7% less likely to have obesity than those in one of the 25% lowest walkable tracts.
- Children living in a tract with 3 or more parks were 7% less likely to have obesity than those with 0 parks.
- Children who had a higher quality nearest park were less likely to be obese, especially among 12-14-year-olds, girls, and those in higher income neighborhoods.
- Children in the 25% lowest poverty tracts were 20% less likely to have obesity than those living in one of the 25% highest poverty tracts.

DISCUSSION

- Children in the region are less likely to have obesity if they live in a neighborhood that has high walkability, high park access, and/or a moderate-to-low rate of poverty.
- There are many areas of the city where high poverty, low walkability, and low park access co-occur.
- Multiple sectors must work together and strive for ambitious community transformations to combat the existing environmental health disparities in the region.
