# **Development, Implementation, and Evaluation of a Simulation Based Educational Curriculum for Pediatric Hospitalists**

## **BACKGROUND AND OBJECTIVES:**

Minimal published simulation base educational training exists for practicing pediatric hospitalists.

Our aim was to determine specific Pediatric Hospital Medicine (PHM) knowledge, skill and competency needs in alignment with our scope practice and evaluate the impact simulation-based training curriculu

# **DESIGN/METHODS (Figure 1):**

- Needs Assessment/Baseline survey administered
  - Utilized self-ratings from Novice to Expert (5-point Likert scale) on publi PHM competencies
  - Responses averaged into specific domain scores, bundled according to learning content needs
- Six targeted simulation sessions developed, piloted and implemented
- Educational evaluations following each session rated learning objectives methods from Very Poor to Excellent (5-point Likert scale)
- Post-training survey administered

### **Data Analysis:**

- Participant deemed competent in a domain if mean score Score analysis performed using Sign Rank and McNemar's Tests (Table 1)
- Determined if score changed for each domain based on experience or session attendance using Kruskal–Wallis test
- Educational session evaluations compiled by ratings

			** McNemar's test		

mpleting the post-training assessment. The median number years of experience as an attending was 4. Areas with the west self-reported competency on the baseline assessment cluded medically complex care, code cart, vascular access & nergency medications, advanced airway management, and am communication (Table 1).

**RESULTS:** Baseline survey response rate was 98% with 85%

ost curriculum scores improved significantly for 5 of 9 domains Ind percent competent in one domain. Mean scores increased ≥3 in all domains reaching the designated self-assessment mpetency threshold (Table 1). Change in scores was not sociated with years of experience or increased session tendance. Figure 2 includes example responses to questions <sup>5</sup> perceived impact on clinical care. Overall, participants rated e educational sessions "good" or "excellent" at a rate of 98%.

**NCLUSIONS**: Results from a baseline assessment were strumental in designing a simulation-based faculty education rriculum. Post-training analysis revealed gains in multiple domains and identified future opportunities for targeted intervention to address persistent competency gaps. Hospitalists reported participation in simulation sessions positively impacted patient care and team communication.

As new subspecialists, pediatric hospitalists across the country may find value in a similar process to provide novel faculty education.

**<u>ACKNOWLEDGEMENTS</u>**: Data collected using Research Electronic Data Capture (REDCap), designed and administered by Kelli L Behr, Data Analyst, REDCap Project Administrator. The QR Code to the right includes a demonstration of the surveys.
